Trans. of Radex Rundschau (Austria) 1955, no. 1, p. 301-318.

The existing solutions of Fourier's differential equation for a nonstationary temperature field are combined into a simple approximation equation, from which it is possible to calculate with sufficient accuracy from the temperature conditions in the heat-storing elements the coefficients of heat transfer for the reversal half-periods. Graphical methods for doing this very simply are indicated. The dimensions of the various parts of regenerators, both with stationary and with moving (rotating) heat storage masses, are calculated. A method of working out the economic value of a regenerator is indicated, and with various assumptions which (Engineering--Mechanical, TT, v. 5, no. 2) (over)
